

Introduction to Asset Management

15th September 2010, London, UK

What is Asset Management and why is it important?

Asset management is a discipline that allows businesses with physical assets to achieve their stated business objectives in the most cost effective way. The more asset intensive the business operation, then the more vital the reliability, availability, maintenance and safety of those assets is to the business's performance. Good infrastructure asset managers can produce substantial benefits to a business's bottom-line both through a reduction in the requirements for resources without detriment to asset stewardship or an increase in overall business risk. Good asset management is therefore essential to any business faced with achieving its stated objectives with fewer resources.

Each one-day course will give attendees an introduction to the discipline of asset management, and includes an introduction to the role of the BSI's Publicly Available Specification for Asset Management (BSI PAS 55).

The course is suitable for any person who is new to Asset Management and who requires a clear introduction to the subject, its benefits, and the approaches that asset intensive organisations can adopt to improve the whole-life management of the physical assets under their care.

Course highlights include:

- Introduction to Asset Management frameworks including PAS 55
- Applicability & benefits of Asset Management
- Achieving compliance with PAS 55
- Introduction to the main Asset Management concepts of Whole Life Costing and Asset Information Management
- Improvement planning and implementation
- 'Beyond PAS 55 Compliance'
